

UNISOLE AI CAMPUS PROGRAM

GROUP 1 — COMPUTER SCIENCE & IT

Common Pathway: AI Entrepreneurship & Innovation

Target students: BCA • MCA • B.Sc. CS/IT • PGDCA • B.Tech CSE/IT • Related disciplines

Format: Weekend pathway (Saturday + Sunday), taken alongside either technical pathway (ML Engineering or Full Stack Web Development)

Overview

This track exists so technical students don't just learn to build — they learn to identify what's worth building. It follows the same discovery-to-pitch arc a real startup would go through, compressed into a weekend format so it doesn't compete with weekday technical learning time. Every module moves the student one step closer along a single line: **Problem** → **Validated Idea** → **MVP** → **Business Model** → **Pitch**.

Why this pathway matters: Technical skill without the ability to identify a real problem worth solving produces impressive but unused projects. This track ensures every technical capstone is grounded in something a real user would actually want.

Module 1 — Problem Discovery

Every good product starts with a real, specific problem — not a vague idea. This module trains students to find that problem rigorously instead of assuming they already know it.

Topics covered:

- Design thinking — a structured approach to human-centered problem solving
- Problem identification — separating symptoms from root causes
- User pain points — understanding what's actually frustrating for real users
- Problem statements — writing a clear, testable statement of the problem being solved

Skills gained: The discipline to validate a problem exists before building a solution for it.

Module 2 — Market Discovery

Once a problem is identified, students learn whether it's a problem worth solving at scale — and who exactly experiences it.

Topics covered:

- Customer discovery — talking to real potential users to test assumptions
- Market research — understanding the size and shape of an opportunity
- Competitor analysis — knowing what already exists and why it isn't enough
- Target customer — defining precisely who the product is for

Skills gained: The ability to back up a product idea with real market evidence, not just intuition.

Module 3 — AI Opportunity

This module connects the entrepreneurship track back to the technical skills students are building — helping them see specifically where AI adds real value rather than being used as a buzzword.

Topics covered:

- Where AI can create value — recognizing genuine AI opportunities vs hype
- AI automation — replacing repetitive manual work
- AI-enabled products — where AI is the core differentiator, not an add-on
- Human + AI workflows — designing systems where AI augments people rather than replacing them

Skills gained: The judgment to know when AI is the right tool for a problem — and when it isn't.

Module 4 — MVP

Turning an idea into something real enough to test — quickly, and without over-building.

Topics covered:

- Minimum viable product — the smallest version of a product that can test the core hypothesis
- Prototyping — quickly building something users can actually react to
- No-code/low-code + AI tools — building fast without needing a full engineering team
- Product validation — testing whether the MVP actually solves the problem

Skills gained: The ability to move from idea to testable product quickly, without wasting months building the wrong thing.

Module 5 — Business Model

A great product still needs a viable business behind it. This module covers how a product idea turns into something that can sustain itself.

Topics covered:

- Value proposition — clearly articulating why a customer would choose this product
- Revenue models — the different ways a product can make money
- Pricing — setting a price that reflects value and market reality
- Business Model Canvas — a structured framework for mapping an entire business on one page

Skills gained: The ability to explain not just what a product does, but how it would actually sustain itself as a business.

Module 6 — Go-to-Market

Building something great is only half the challenge — this module covers how it actually reaches real users.

Topics covered:

- Customer acquisition — how new users are found and won
- Marketing fundamentals — the basic principles behind reaching an audience
- Digital presence — building visibility online

Skills gained: A basic, practical understanding of how a product actually gets in front of the people it's built for.

Module 7 — Pitching

The final skill: communicating an idea persuasively and credibly, whether to an investor, a customer, or a hiring panel.

Topics covered:

- Problem, Solution, Market, Business model — the core narrative arc of any pitch
- Competitive advantage — articulating why this idea wins
- Pitch deck — building a clear, visual pitch narrative
- Investor/customer pitch — delivering the pitch live, under questioning

Skills gained: The confidence and structure to present an idea clearly and defend it under scrutiny — a skill that transfers directly to interviews as well as fundraising.

Final Output

Problem → Validated Idea → MVP → Business Model → Pitch

Students leave this track with a fully reasoned business case for an idea — validated against a real problem, tested with real users where possible, and backed by a business model and a pitch they can deliver confidently.

Career & academic relevance: Product Manager track, Startup Founder, Innovation/Entrepreneurship roles, and — for students not pursuing a startup — a materially stronger ability to frame and pitch their technical capstone projects.

Industry-Readiness Layer (*applies alongside this track*)

Professional Digital Profile: Professional email, LinkedIn, Resume, Portfolio, Project documentation, Professional communication.

Interview Preparation: Resume walkthrough, Tell-me-about-yourself, Project explanation, Behavioural questions, Technical/domain questions, Mock interview, Feedback.

Industry Interaction: Weekly/periodic expert sessions, Career sessions, Industry case studies, How companies recruit, How to approach professionals, Networking etiquette.

Project Defence: Every student must be able to answer — What problem did you solve? Why did you choose this approach? What did you build? What did you learn? What are the limitations? What would you improve?

Training and assessment are program components. Internship, advanced projects, hackathons, research engagement and other opportunities are performance/availability-based and subject to applicable

selection procedures.
