

UNISOLE AI CAMPUS PROGRAM

GROUP 3 — COMMERCE, BBA & MANAGEMENT

Common Pathway: AI Entrepreneurship & Innovation

Target students: B.Com • BBA • BBM • M.Com • MBA/Management • Economics • Finance-related disciplines

Format: Delivered alongside either Business Analytics or AI in Finance & FinTech, using business-specific examples

Overview

This is the same entrepreneurship curriculum delivered across the program, but grounded entirely in business-specific scenarios so commerce students apply every concept to situations close to their own discipline: FinTech startups, AI marketing tools, SME analytics platforms, AI accounting assistants, customer intelligence platforms, and local-business automation.

Why this pathway matters: Commerce and management students are natural candidates to found or lead businesses — but many never get structured practice validating an idea before committing to it. This track builds that discipline directly, using examples they will recognize from their own coursework and career interests.

Module 1 — Problem Discovery

Every good business starts with a real, specific problem — not a vague idea. This module trains students to find that problem rigorously.

Topics covered:

- Design thinking — a structured approach to human-centered problem solving
- Problem identification — separating symptoms from root causes
- User pain points — understanding what's actually frustrating for real customers or businesses
- Problem statements — writing a clear, testable statement of the problem being solved

Business examples used: A small business struggling to track finances manually; a lender unable to assess credit risk quickly enough.

Module 2 — Market Discovery

Once a problem is identified, students learn whether it's a problem worth solving at scale — and who exactly experiences it.

Topics covered:

- Customer discovery — talking to real potential customers to test assumptions
- Market research — understanding the size and shape of an opportunity
- Competitor analysis — knowing what already exists and why it isn't enough

- Target customer — defining precisely who the product or service is for

Business examples used: Sizing the market for an SME analytics tool; identifying which segment of small businesses most needs an AI accounting assistant.

Module 3 — AI Opportunity

This module helps students recognize specifically where AI adds real value in a business context, rather than being used as a buzzword.

Topics covered:

- Where AI can create value in a business — recognizing genuine opportunities vs hype
- AI automation — replacing repetitive manual business processes
- AI-enabled products — where AI is the core differentiator
- Human + AI workflows — designing systems where AI augments staff rather than replacing them

Business examples used: Where AI could realistically improve a FinTech lending workflow; how an AI marketing tool could out-perform a manual campaign process.

Module 4 — MVP

Turning a business idea into something real enough to test — quickly, and without over-building.

Topics covered:

- Minimum viable product — the smallest version of a business idea that can test the core hypothesis
- Prototyping — quickly building something customers can actually react to
- No-code/low-code + AI tools — building fast without needing a full engineering team
- Product validation — testing whether the MVP actually solves the problem

Business examples used: A no-code MVP for a customer intelligence dashboard; a simple prototype for a local-business automation tool.

Module 5 — Business Model

A great idea still needs a viable business behind it. This module covers how a business idea turns into something that can sustain itself.

Topics covered:

- Value proposition — clearly articulating why a customer would choose this
- Revenue models — the different ways a business idea can make money
- Pricing — setting a price that reflects value and market reality
- Business Model Canvas — a structured framework for mapping an entire business on one page

Business examples used: Pricing models for a subscription-based SME analytics platform; revenue models for a FinTech startup.

Module 6 — Go-to-Market

Building something great is only half the challenge — this module covers how it actually reaches real customers.

Topics covered:

- Customer acquisition — how new customers are found and won
- Marketing fundamentals — the basic principles behind reaching an audience
- Digital presence — building visibility online

Business examples used: How a local-business automation product would actually reach small business owners; digital marketing for an early-stage FinTech product.

Module 7 — Pitching

The final skill: communicating a business idea persuasively and credibly, whether to an investor, a customer, or a hiring panel.

Topics covered:

- Problem, Solution, Market, Business model — the core narrative arc of any pitch
- Competitive advantage — articulating why this idea wins
- Pitch deck — building a clear, visual pitch narrative
- Investor/customer pitch — delivering the pitch live, under questioning

Skills gained: The confidence and structure to present a business idea clearly and defend it under scrutiny — directly transferable to internship and job interviews as well as fundraising.

Final Output

Problem → Validated Idea → MVP → Business Model → Pitch

Students leave this track with a fully reasoned, business-specific idea — validated against a real problem, tested where possible, and backed by a business model and pitch they can deliver confidently.

Career relevance: Product Manager, Business Development, Startup Founder, Management Trainee, and a materially stronger ability to frame and pitch their Business Analytics or FinTech capstone project.

Industry-Readiness Layer (*applies alongside this track*)

Professional Digital Profile: Professional email, LinkedIn, Resume, Portfolio, Project documentation, Professional communication.

Interview Preparation: Resume walkthrough, Tell-me-about-yourself, Project explanation, Behavioural questions, Technical/domain questions, Mock interview, Feedback.

Industry Interaction: Weekly/periodic expert sessions, Career sessions, Industry case studies, How companies recruit, How to approach professionals, Networking etiquette.

Project Defence: Every student must be able to answer — What problem did you solve? Why did you choose this approach? What did you build? What did you learn? What are the limitations? What would you improve?

Training and assessment are program components. Internship, advanced projects, hackathons, research engagement and other opportunities are performance/availability-based and subject to applicable

selection procedures.
