

UNISOLE AI CAMPUS PROGRAM

GROUP 3 — COMMERCE, BBA & MANAGEMENT

Pathway 2: AI in Finance & FinTech

Target students: B.Com • BBA • M.Com • MBA/Management • Economics • Finance-related disciplines

Overview

This pathway is for students specifically interested in finance, banking, and the fast-growing FinTech sector. It covers the modern financial technology landscape, core financial analysis skills, and how AI is used in real financial decision-making — including the governance and ethical considerations that regulated industries require.

Why this pathway matters: Finance is one of the industries being most rapidly transformed by AI — in fraud detection, credit decisions, and risk management. Finance graduates who understand both the analysis and the AI systems behind it are positioned well ahead of those with traditional finance training alone.

Module 1 — Financial Technology Landscape

An orientation to how financial services actually work today, across the major categories of modern FinTech.

Topics covered:

- Digital banking — how banking has moved online and mobile-first
- UPI and Digital payments — the infrastructure behind modern transactions
- Neobanks — digital-only banking models
- Lending technology — how loans are originated and processed digitally
- InsurTech — technology-driven insurance
- RegTech — technology for regulatory compliance

Skills gained: A current, practical map of the financial technology industry that most traditional finance courses don't cover.

Module 2 — Financial Data

Financial analysis is only as good as the data behind it — this module covers the core data types finance professionals work with daily.

Topics covered:

- Financial statements — the core documents behind any financial analysis
- Market data — pricing, rates, and market movements
- Transaction data and Customer data
- Data quality — why bad financial data is especially costly

- Financial KPIs — the metrics finance teams actually track

Skills gained: Fluency reading and working with the data types used in real financial analysis roles.

Module 3 — Financial Analytics

The core analytical techniques used to evaluate the financial health and performance of a business.

Topics covered:

- Revenue analysis and Profitability
- Cash flow — understanding the movement of money, not just profit on paper
- Ratios — the standard tools for comparing financial performance
- Forecasting and Trend analysis — projecting forward from historical data

Skills gained: Practical, applied financial analysis skills that map directly onto real analyst and finance-associate roles.

Module 4 — AI in Finance

Where AI is already having the biggest real-world impact in financial services — automating decisions that used to require large manual review teams.

Topics covered:

- Fraud detection — identifying suspicious transactions automatically
- Credit scoring — using data to assess creditworthiness
- Risk analytics — quantifying and managing financial risk
- Customer segmentation and Churn prediction
- Financial forecasting — AI-enhanced prediction of financial outcomes
- Algorithmic decision support — how AI assists (not replaces) financial decision-makers

Skills gained: A concrete understanding of where and how AI is actually deployed inside financial institutions today.

Module 5 — FinTech Systems

The systems and infrastructure layer behind modern financial products.

Topics covered:

- Payment systems and Digital lending
- Risk systems — the infrastructure behind automated risk decisions
- Open banking concepts — how financial data is shared securely between institutions
- APIs — how financial systems connect to each other
- Financial data pipelines — how financial data actually flows through a company's systems

Skills gained: A systems-level understanding of how FinTech products are actually built and operated, beyond just the front-end product.

Module 6 — Responsible AI in Finance

Because financial decisions directly affect people's lives and livelihoods, this module ensures students understand the governance side of AI in finance, not just the technical side.

Topics covered:

- Bias — how AI systems can unintentionally discriminate, and how to guard against it
- Explainability — why financial AI decisions must be justifiable, not just accurate
- Privacy — protecting sensitive financial data
- Governance and Human oversight — keeping humans accountable for AI-assisted decisions
- Model risk — understanding what can go wrong when an AI model is trusted too much

Skills gained: The ethical and regulatory literacy that is increasingly required for any AI-adjacent role in a regulated industry like finance.

Capstone Project

AI-Assisted Financial Risk / Fraud Analytics System

Data → Analysis → Model → Dashboard → Business recommendation

Students build a working system that takes financial or transactional data through analysis and modelling to a dashboard and a set of concrete recommendations — directly mirroring the kind of project a junior risk or fraud analyst would be expected to contribute to.

Tools & technologies used across this pathway: Excel, SQL, financial analytics techniques, AI/ML concepts applied to fraud and risk, dashboarding tools.

Career relevance: Financial Analyst, Risk Analyst, Fraud Analyst, FinTech Product/Operations roles, Credit/Lending Analyst, Compliance and RegTech roles.

Student outputs: A working risk/fraud analytics prototype, a dashboard, and a business recommendation report, presented and defended.

Industry-Readiness Layer *(applies alongside this pathway)*

Professional Digital Profile: Professional email, LinkedIn, Resume, Portfolio, Project documentation, Professional communication.

Evidence: Portfolio, Dashboard/report, Research documentation, Project presentation.

Interview Preparation: Resume walkthrough, Tell-me-about-yourself, Project explanation, Behavioural questions, Technical/domain questions, Mock interview, Feedback.

Industry Interaction: Weekly/periodic expert sessions, Career sessions, Industry case studies, How companies recruit, How to approach professionals, Networking etiquette.

Project Defence: Every student must be able to answer — What problem did you solve? Why did you choose this approach? What did you build? What did you learn? What are the limitations? What would you improve?

Final Capstone Framework

1. **Problem** — Identify a real-world problem
2. **Research** — Understand the domain and existing solutions
3. **Data/Information** — Collect and organize relevant information
4. **Build** — Create the appropriate financial/business solution
5. **Validate** — Test the solution and interpret results
6. **Document** — Report, Repository/portfolio, Documentation, Presentation
7. **Defend** — Present the project before an evaluator/mentor

What This Student Should Have at the End

Business Analysis + Dashboard/Report + Financial/Business Project + Presentation

Training and assessment are program components. Internship, advanced projects, hackathons, research engagement and other opportunities are performance/availability-based and subject to applicable selection procedures.
