

UNISOLE AI CAMPUS PROGRAM

GROUP 3 — COMMERCE, BBA & MANAGEMENT

Pathway 1: Business Analytics

Target students: B.Com • BBA • BBM • M.Com • MBA/Management • Economics • Finance-related disciplines

Overview

This pathway trains students to move from raw business data to actionable recommendations — the core skill behind roles like business analyst, data analyst, and operations analyst. It progresses from foundational data handling through to full analytics dashboards, then adds an AI layer so students can use generative AI to accelerate their own analysis work.

Why this pathway matters: Business graduates are trained to understand strategy and operations, but often lack the hands-on data tooling that turns that understanding into a hireable analytics skillset. This pathway builds exactly that bridge.

Module 1 — Business Data Foundations

Before students can analyze anything, they need to understand what business data actually looks like and where it comes from — this module sets that groundwork.

Topics covered:

- Types of business data — sales, financial, operational, customer data
- Data sources — where business data actually comes from inside a company
- Structured vs unstructured data
- Data quality, Data collection, Data validation — ensuring analysis starts from trustworthy data

Skills gained: The judgment to evaluate whether a dataset is reliable enough to base a business decision on.

Module 2 — Excel for Business

Excel remains the single most-used analytics tool in business roles. This module goes beyond basic formulas into the techniques analysts use daily.

Topics covered:

- Advanced formulas and Lookup functions (VLOOKUP/XLOOKUP-style logic)
- Pivot tables — summarizing large datasets instantly
- Data cleaning and Conditional logic
- Financial/business calculations
- Dashboard basics — building simple reporting views directly in Excel

Skills gained: Genuine advanced-Excel fluency — the single most commonly tested skill in business analyst interviews.

Module 3 — SQL for Business

SQL lets analysts pull exactly the data they need directly from a company's database instead of relying on someone else to extract it — a skill that significantly increases a business graduate's independence and value.

Topics covered:

- Databases — how business data is actually stored
- SELECT and Filtering — retrieving exactly the data needed
- Aggregation and GROUP BY — summarizing data by category
- JOINS — combining data from multiple tables
- Subqueries — building more complex, layered queries
- Business queries — applying SQL directly to real business questions

Skills gained: The ability to independently query a company's data rather than depending on a data team for every request.

Module 4 — Data Engineering for Analysts

A simplified but real introduction to how data flows through a company's systems before it ever reaches a dashboard — so students understand the pipeline behind the numbers, not just the numbers themselves.

Topics covered:

- OLTP vs OLAP — transactional systems vs analytical systems
- Data warehouses — where company-wide data is centralized
- ETL vs ELT — how data is moved and transformed
- Batch vs streaming — data delivered periodically vs continuously
- Parquet, DuckDB — modern lightweight data tools
- Kafka fundamentals — how real-time data streaming works

Skills gained: A working mental model of where the numbers on a dashboard actually come from — valuable context most business analysts never get.

Module 5 — Business Analytics

The analytical core of the pathway — moving from simply describing what happened to predicting and prescribing what should happen next.

Topics covered:

- Descriptive analytics — what happened
- Diagnostic analytics — why it happened
- Predictive analytics — what's likely to happen next
- Prescriptive analytics — what should be done about it
- KPI design — defining the metrics that actually matter

- Sales analytics, Customer analytics, Marketing analytics, Operations analytics — applying the analytics framework across every major business function

Skills gained: The ability to move an analysis beyond description into genuine business recommendation.

Module 6 — Visualization & BI

Analysis is only useful if it can be communicated. This module teaches students to turn numbers into dashboards and narratives that decision-makers can act on.

Topics covered:

- Dashboard design — building clear, decision-ready views
- Data storytelling — presenting numbers as a persuasive narrative, not just a chart
- Charts and KPIs — choosing the right visual for the right message
- Business dashboards
- Power BI / BI concepts — the tools used in most real analytics teams

Skills gained: The ability to present analysis in a way that actually drives a decision, not just displays data.

Module 7 — AI for Business

The differentiator: students learn to use generative AI as a working tool for analysis, research, and communication — not as a separate technical subject.

Topics covered:

- Generative AI and Prompt engineering
- AI-assisted analytics — accelerating analysis work with AI tools
- Business research and Document analysis with AI
- Workflow automation
- AI decision support — using AI to strengthen, not replace, business judgment

Skills gained: Practical fluency using AI tools to work faster and more thoroughly than a traditional analyst — a rapidly growing expectation in analytics roles.

Capstone Project

Retail Business Intelligence System

Sales data → ETL → SQL → Analytics → Dashboard → Business recommendations

Students take raw retail sales data all the way through to a finished dashboard and a set of concrete, evidence-backed business recommendations — mirroring exactly what a junior business analyst would be expected to deliver in their first months on the job.

Tools & technologies used across this pathway: Excel, SQL, DuckDB, Power BI / BI concepts, generative AI tools for analytics.

Career relevance: Business Analyst, Data Analyst, Operations Analyst, Marketing Analyst, MIS Executive, entry-level Analytics Consultant roles.

Student outputs: A full analytics pipeline from raw data to dashboard, a written business recommendation report, and a presentation defending the analysis.

Industry-Readiness Layer (*applies alongside this pathway*)

Professional Digital Profile: Professional email, LinkedIn, Resume, Portfolio, Project documentation, Professional communication.

Evidence: Portfolio, Dashboard/report, Research documentation, Project presentation.

Interview Preparation: Resume walkthrough, Tell-me-about-yourself, Project explanation, Behavioural questions, Technical/domain questions, Mock interview, Feedback.

Industry Interaction: Weekly/periodic expert sessions, Career sessions, Industry case studies, How companies recruit, How to approach professionals, Networking etiquette.

Project Defence: Every student must be able to answer — What problem did you solve? Why did you choose this approach? What did you build? What did you learn? What are the limitations? What would you improve?

Final Capstone Framework

1. **Problem** — Identify a real-world problem
2. **Research** — Understand the domain and existing solutions
3. **Data/Information** — Collect and organize relevant information
4. **Build** — Create the appropriate business solution
5. **Validate** — Test the solution and interpret results
6. **Document** — Report, Repository/portfolio, Documentation, Presentation
7. **Defend** — Present the project before an evaluator/mentor

What This Student Should Have at the End

Business Analysis + Dashboard/Report + Financial/Business Project + Presentation

Training and assessment are program components. Internship, advanced projects, hackathons, research engagement and other opportunities are performance/availability-based and subject to applicable selection procedures.
